* continues in PhD  ** discontinued
Students:

**Scientific initiation students (5)**

- Barbara Garcia São José** (Bacharel em Ciências Biológicas)
- Pedro Henrique Vendramini (Química Ambiental – IBILCE/UNESP)
- Marcos Rechi Siqueira (Química Ambiental – IBILCE/UNESP)
- Jéssica F. Alves dos Santos (Química Ambiental – IBILCE/UNESP)
- Felipe Tomasello Correa (Química Ambiental – IBILCE/UNESP)

** discontinued
Summary

Biodiesel is an alternative to the conventional diesel, and can be produced from the transesterification reaction of triglycerides found in vegetable oils or animal fats and alcohols such as methanol or ethanol.

A promising route of this reaction is the enzymatic catalysis using lipases. This study aimed at selecting fungal strains capable of producing lipolytic enzymes with transesterification property to be used for the production of biodiesel via ethylic transesterification.

The ability of transesterification of enzymes was evaluated in both free, immobilized on supports and also, immobilized in its own hyphae. The results obtained so far are presented below.
Figure 1. Chemistry of the reaction for biodiesel production. R1, R2, and R3 are alkyl groups with different lengths attached to glycerol of the triglyceride molecule. Lipase promotes the catalysis of the triglyceride hydrolysis to produce free fatty acid and transfers the free fatty acid to the ethanol molecule to form the mono-alkyl ester (or diesel) and crude glycerol.

MAIN RESULTS

A. Isolation of Microorganisms

At least 7 different strains of fungi with transesterifying activity and positive for biodiesel synthesis, were isolated and identified. Some until genera some until species, including:

1) *Thermomucor indicae-seudatica*  
2) *Myceliophtora thermophila*  
3) *Rhizomucor pusillus*  
4) *Thermomyces lanuginosus*  
5) *Acremonium sp* (Mesophilic)  
6) *Fusarium sp* (Mesophilic)  
7) *Aspergillus sp* (Mesophilic)

* *novelty*

Other potential are in the process of identifying
B. Imobilizations

1) The lipase *Myceliophtora* spp. was immobilized in calcium alginate and chitosan being possible to reuse for 6 and 12 times consecutively, respectively.

2) In the culture medium itself (hyphae) *R. pusillus*, *T. lanuginosus* and *T. indicae-seudaticae*

3) Vegetables bushings: *Myceliophtora sp* and *R. pusillus*. Transesterification were improved compared to free enzyme, with yields of 70 and 80% respectively in the conversion of substrates into esters.
Main results

B. Imobilizations

Whole cell immobilization

*Myceliophthora thermophila*

(A) = Wheat bran
(B) = Sugarcane bagasse

*Thermomucor indicae-seudaticae*

(C) Vegetal sponge (Loofah sponges)
C. Quantification and identification of esters by gas chromatography

Figure 8: Chromatograms of ethyl esters standards: palmitate, oleate, linoleate and linolenate (red) and the syntheses performed with immobilized hyphae in wheat bran (black), soybean meal (blue) and sugar cane bagasse (green).

Fungy = *Fusarium* sp (lactis), substrate = Soybean oil
D. Construction of bioreactors

1) A bench top Solid State fermentation (SSF) bioreactor has already been built and operated successfully for the production of fungal lipases with *Myceliophtora* sp.

2) A second larger bioreactor is being developed for production of lipases.
E. Use of Ultrasound

The use of ultrasound irradiation in the transesterification reaction for producing biodiesel from soybean oil and ethanol led to increased conversion of ethyl esters from 92 to 99% showing a very significant effect when used with commercial enzyme.
E. Use of Ultrasound

Figure 2. Experimental set-up for enzymatic biodiesel production with ultrasound: (1) immobilized enzyme, (2) immobilizes mycelium, (3) ultrasound probe, (4) power supply, (5) thermostated vessel, (6) reaction vessel, (7) solvent, (8) water inlet/outlet, (9) stirring equipment, (10) Product of reaction after reaction time and removal of glycerol phase.

Articles resulting from this project

3. Screening and fermentation studies of thermophilic fungus Thermomucor indicae-seudatica N31 for extracellular lipase production (editing).

4. Hyphae immobilization of newly thermophilic fungus Thermomucor indicae-seudatica N31 for biodiesel application and lipase characterization (editing).

5. Immobilization of fungus’s hyphae thermophilic Rhizomucor pusillus for biodiesel production (editing).

6. Optimization of ethylic biodiesel production by ultrasonic irradiation using soybean oil and lipase of Thermomyces lanuginousus (editing).

7. Production and application of lipases of Fusarium sp. in the production of ethyl biodiesel (editing).

8. Production of lipase from the fungus Myceliophthora thermophila by SSF: characterization, and application for ethyl biodiesel production (editing).

9. Isolation and screening of fungi producers of lipases with transesterification actions (editing).
Remarks:
We can point to two main difficulties in the development of this project:
- Development of bioreactors for production of the enzyme in the solid state fermentation (SSF).
Fortunately, we have received a visiting researcher, Prof. Dr Jochen Mellmann, the Leibniz Institute of Agricultural Engineering Potsdam-Bornim (Germany), who is a respected bioreactors researcher, who is now collaborating with this subject.

- The second difficulty is in the process of immobilizing enzymes.
The use of free enzymes in transesterification reactions is not efficient because, in aqueous reaction, it is not favored. So, there is the need for immobilization.

Most of the immobilized lipases were inefficient in converting the biodiesel. Two causes may have contributed to this:
a) enzymes or b) the supports employed. In both cases, they can be sensitive even to the ethanol and solvent used as reactants in the reaction medium. In the case of the enzyme, it could be denatured, and in the case of the support it could be disintegrated.

We are in collaboration with Dr. Benevides Pessela – Research Institute for Food Sciences (CIÁL), Autonomous University of Madrid (Spain)

Highlights
As shown before, our best results for transesterifications were obtained with the immobilization of fungal mycelia, which were confirmed by GC analysis. The results of this project generated one Doctoral thesis, four Masters degree and two monographs. Two papers have been accepted, one is under review and six are being finalized for submission to peer reviewed journals.
Articles published that took advantage of infrastructure acquired with the financial resources of the project (indirect production)
